

Transition contrast under anticipation and under its control

$\Delta S(t) = E[S(t) | A \rightarrow B] - E[S(t) | A \rightarrow C]$. Dark band: pointwise 95% bootstrap. Pale band: sup-t band with simultaneous coverage over all frames and dimensions. Top: transition-dependent anticipation. Bottom: the dynamic no-anticipation control — the trajectory moves throughout the segment, yet the contrast is zero by construction.
